# A Full Characterization of Completeness for Two-party Randomized Function Evaluation 

Daniel Kraschewski, Hemanta K. Maji, Manoj Prabhakaran, Amit Sahai

EUROCRYPT 2014

## What this talk is about

## What this talk is about

- which crypto-gates are all-powerful (such as OT)

## What this talk is about

- which crypto-gates are all-powerful (such as OT) $\rightsquigarrow$ culminates line of research initiated by [Kilian-88]

## What this talk is about

- which crypto-gates are all-powerful (such as OT) $\rightsquigarrow$ culminates line of research initiated by [Kilian-88]

## What this talk is about

- which crypto-gates are all-powerful (such as OT) $\rightsquigarrow$ culminates line of research initiated by [Kilian-88]

- robust foundation of crypto-complexity

## What this talk is about

- which crypto-gates are all-powerful (such as OT) $\rightsquigarrow$ culminates line of research initiated by [Kilian-88]

- robust foundation of crypto-complexity $\rightsquigarrow$ approach for lower complexity bounds?

## What this talk is about

- which crypto-gates are all-powerful (such as OT) $\rightsquigarrow$ culminates line of research initiated by [Kilian-88]
- robust foundation of crypto-complexity $\rightsquigarrow$ approach for lower complexity bounds?

## What this talk is about

- which crypto-gates are all-powerful (such as OT) $\rightsquigarrow$ culminates line of research initiated by [Kilian-88]
- robust foundation of crypto-complexity $\rightsquigarrow$ approach for lower complexity bounds?

- why this is not the end of the road

## What this talk is about

- robust foundation of crypto-complexity $\rightsquigarrow$ approach for lower complexity bounds?

- why this is not the end of the road

## Setting

## Setting

- information-theoretic security

## Setting

- information-theoretic security
- only static corruption

## Setting

- information-theoretic security
- only static corruption
- no fairness (i.e., adversarial party can abort after learning own output)

## Setting

- information-theoretic security
- only static corruption
- no fairness (i.e., adversarial party can abort after learning own output)
- results hold with respect to UC as well as standalone security notions

## How the story started

## How the story started

## Yao's Millionaires' Problem [Yao-82]

## How the story started

## Yao's Millionaires' Problem [Yao-82] <br> - Who has more -bricks? or Xim?

## How the story started

## Yao's Millionaires' Problem [Yao-82]

- Who has more-bricks? or ?
- children love secrets, won't reveal own wealth

## Implications

- 
- constant-rate reduction between complete crypto-gates

## Our contribution

## Main results

(1)

(2)

## Implications

- 
- constant-rate reduction between complete crypto-gates
- robust notion of "crypto-complexity" (independent of underlying gate)

## Our contribution

## Main results

(1) $\begin{aligned} & \text { truth } \\ & \text { table }\end{aligned} \begin{gathered}\text { efficient } \\ \text { algoithm }\end{gathered} \longrightarrow$ not complete
(2)

## Implications

- 
- constant-rate reduction between complete crypto-gates
- robust notion of "crypto-complexity" (independent of underlying gate)
- new approach for lower bounds?

## Starting point: semi-honest completeness

Efficient characterization of malicious completeness

## Malicious completeness

## Redundancy

maliciously use only part of the crypto-gate, yet emulate honest behavior

|  | $(0,0)$ | $(0,1)$ | $(1,0)$ | $(1,1)$ | $(2,0)$ | $(2,1)$ | $(2,2)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(0,0)$ | $1 / 4$ | $1 / 4$ |  | 1 | $1 / 8$ | $1 / 8$ | $1 / 2$ |
| $(0,1)$ | $1 / 4$ | $1 / 4$ |  |  | $1 / 8$ | $1 / 8$ |  |
| $(1,0)$ |  |  | $1 / 4$ | $1 / 4$ |  | $1 / 8$ | $1 / 8$ |
| $(1,1)$ | 1 |  | $1 / 4$ | $1 / 4$ | $1 / 2$ | $1 / 8$ | $1 / 8$ |

Efficient characterization of malicious completeness
(1) detect redundancies (use linear programming)

## Malicious completeness

## Redundancy

maliciously use only part of the crypto-gate, yet emulate honest behavior

|  | $(0,0)$ | $(0,1)$ | $(1,0)$ | $(1,1)$ |
| :---: | :---: | :---: | :---: | :---: |
| $(0,0)$ | $1 / 4$ | $1 / 4$ |  | 1 |
| $(0,1)$ | $1 / 4$ | $1 / 4$ |  |  |
| $(1,0)$ |  |  | $1 / 4$ | $1 / 4$ |
| $(1,1)$ | 1 |  | $1 / 4$ | $1 / 4$ |

Efficient characterization of malicious completeness
(1) detect redundancies (use linear programming)
(2) keep removing redundancies, eventually obtain redundancy-free "core"

## Malicious completeness

## Redundancy

maliciously use only part of the crypto-gate, yet emulate honest behavior

|  | $(0,0)$ | $(0,1)$ | $(1,0)$ | $(1,1)$ |
| :---: | :---: | :---: | :---: | :---: |
| $(0,0)$ | $1 / 4$ | $1 / 4$ |  | 1 |
| $(0,1)$ | $1 / 4$ | $1 / 4$ |  |  |
| $(1,0)$ |  |  | $1 / 4$ | $1 / 4$ |
| $(1,1)$ | 1 |  | $1 / 4$ | $1 / 4$ |

Efficient characterization of malicious completeness
(1) detect redundancies (use linear programming)
(2) keep removing redundancies, eventually obtain redundancy-free "core"
(3) malicious complete $\Leftrightarrow$ core is semi-honest complete

## Malicious completeness

## Redundancy

maliciously use only part of the crypto-gate, yet emulate honest behavior

|  | $(0,0)$ | $(0,1)$ | $(1,0)$ | $(1,1)$ |
| :---: | :---: | :---: | :---: | :---: |
| $(0,0)$ | $1 / 4$ | $1 / 4$ |  | 1 |
| $(0,1)$ | $1 / 4$ | $1 / 4$ |  |  |
| $(1,0)$ |  |  | $1 / 4$ | $1 / 4$ |
| $(1,1)$ | 1 |  | $1 / 4$ | $1 / 4$ |

Efficient characterization of malicious completeness
(1) detect redundancies (use linear programming)
(2) keep removing redundancies, eventually obtain redundancy-free "core"
(3) malicious complete $\Leftrightarrow$ core is semi-honest complete

## Complete construction

## Commitment construction

## Commitment construction

## use crypto-gate as "channel"

$$
\text { "sends" }(x, a) \text { "receives" }(y, b)
$$

## Commitment construction

## use crypto-gate as "channel"

hiding: push information through channel at larger rate than capacity

## Commitment construction

## use crypto-gate as "channel"

$$
3 \text { "sends" }(x, a)
$$

"receives" $(y, b)$
hiding: push information through channel at larger rate than capacity binding: use good enough relative distance code

## Commitment construction

## use crypto-gate as "channel"

$$
3 \text { "sends" }(x, a)
$$

## 新 "receives" $(y, b)$

hiding: push information through channel at larger rate than capacity binding: use good enough relative distance code

## Caveats

## Commitment construction

## use crypto-gate as "channel"

$$
\because \text { "sends" }(x, a)
$$

"receives" $(y, b)$
hiding: push information through channel at larger rate than capacity binding: use good enough relative distance code

## Caveats

- receiver influences channel

## Commitment construction

## use crypto-gate as "channel"

$$
3 \text { "sends" }(x, a)
$$

hiding: push information through channel at larger rate than capacity binding: use good enough relative distance code

## Caveats

- receiver influences channel
- redundancy-free $\nRightarrow$ unfakeable input distributions

## Open Questions \& Related Fields

## Non-interactive completeness

related to Decomposable Randomized Encodings

## what we know

- string-OT from bit-OT
[Brassard-Crépeau-Santha-96]
- NC ${ }^{1}$-NISC from OT, general NISC from OT+PRG
[Ishai-Kushilevitz-Ostrovsky-Prabhakaran-Sahai-11]

## open questions

- general information-theoretic NISC from OT?

## Leaky \& unfair primitives

## what we know

- completeness criteria for unfair noisy channels
[Crépeau-Kilian-88,
Damgård-Kilian-Salvail-99, Damgård-Fehr-Morozov-Salvail-04, Wullschleger-09]

## open questions

- more complex crypto-gates?
- deterministic crypto-gates?

$$
f_{\mathrm{A}}(x, y, z, r)
$$

$f_{\mathrm{B}}(x, y, z, r)$

## related to Combiners and Extractors

## Non-complete crypto-gates

## what we know

- classification of trivial crypto-gates
complete
[Kushilevitz-92, Beimel-Malkin-Micali-99,
Künzler-MüllerQuade-Raub-09,
Maji-Prabhakaran-Rosulek-09]
- examples for infinite hierarchy
[Kilian-Kushilevitz-Micali-Ostrovsky-00,
Maji-Prabhakaran-Rosulek-09]
- Non-complete crypto-gates are symmetric!

## open questions

- concrete equivalence classes?
- constant-rate vs arbitrary (efficient) reduction?

## related to Black-Box Separations

## More than $O(1)$-size

## this work

- $O(1)$-size $\rightsquigarrow$ efficient protocol for negligible error
- $O\left(2^{k}\right)$-size $\rightsquigarrow$ exponential complexity for negligible error?

## what we know

- highly structured examples (e.g., string-OT, OPE)
- black-box reductions for oracle functionalities, e.g., IC and RO [Luby-Rackoff-88, Coron-Patarin-Seurin-08, Holenstein-Künzler-Tessaro-11, Baecher-Brzuska-Mittelbach-13]
- Random Oracle $\equiv$ Commitments
[Mahmoody-Maji-Prabhakaran-12]

## open questions

- completeness criteria for oracles?
- good definition for interesting crypto-gates with infinite number of possible inputs?

## Computationally bounded adversaries

## what we know

- An asymmetric $F$ is complete, iff for some $x_{0}, x_{1}$ it is infeasible to reduce $f\left(x_{1}, \cdot\right)$ to $f\left(x_{0}, \cdot\right)$ [Harnik-Naor-Reingold-Rosen-04].
- Assuming a computational semi-honest OT protocol, (almost) every 2-party functionality is either trivial or complete [Maji-Prabhakaran-Rosulek-10, Rosulek-12].
- In the semi-honest model, any constant round protocol for a nontrivial $O(1)$-size function can be turned into an OT protocol [Lindell-Omri-Zarosim-12].
- black-box separations between OT, key-agreement, CRHF, OWF [Impagliazzo-Rudich-89, Simon-98, Gertner-Kannan-Malkin-Reingold-Viswanathan-00, Gertner-Malkin-Reingold-01]

## open questions

- non-black-box reduction of OT to one-way functions?
